

These steel tubes are stored, elevated, oriented, length inspected, distributed and escaped through four paths to an exhaust manifold assembly station. Despite a natural tendency to telescope together, they are reliably fed within sound pressure limits of 80 dBA at 3 ft.

One machine performs all the feed **and** inspection functions where six bowl feeders were first considered.

Think "Straightline" for quiet, compact, extra function feed systems.

You'll profit with Spectrum's Straightline feeders.
