

Here's one of four feeders we built to handle finished Roller Bearing Assemblies.

Bearings are fed out two paths to inspection, noise test, and packaging operations at 60 per minute.

Vibratory preorienting tooling gets nearly every part face selected by a rim radius. Only 2 percent of the parts are recirculated before they exit through the distributor tooling.

Sound pressure is held below 80 DBA.

2, 4, 8 Or More...

... feed paths from one orientor?

It's easy with **Spectrum's** straight line tooling methods.

Get your parts oriented, sorted, inspected, and distributed to multipaths quietly.

Get with **the feeder people. Spectrum.**

Call, write, or drop in.
