

Engine water jacket plugs are fed to an assembly machine through eight flexible tracks with this machine.

Damaged and odd sized plugs are sorted and ejected to scrap before track entry. It's all done at less

than 80 dBA sound pressure.

This machine replaced four, noisy, hand filled bowl feeders which couldn't keep bad parts from the assembly machine.

Why spend...

... so **much** time choosing a machine tool and so **little** for it's feeders?

Don't make your feeder choice casual or hasty. Be sure!

Get with Spectrum's experts to be sure.
