

This Spectrum storage feeder uses a batch weight discharge unit to get parts into chemical treatment carrier baskets.

Parts are elevated, from the storage feeder bin, to a counter-weighted collection box. When a preset weight is reached, the feeder stops. An empty carrier basket signals itself ready for filling. An exten-

sion chute moves to the basket opening and the parts are released. The chute retracts and a new cycle starts.

You can't afford a shovel or the man using it. Load your process operations with Spectrum feed units. You **can** afford Spectrum.

Shovels are cheap ...

... but men with shovels aren't.

Many process systems are still controlled by men with shovels.

Call, write or drop in and let Spectrum help.

You'll profit.
