

Here's a special vibratory feed track with inspection tooling built in. Unwanted materials are stopped and ejected **before** they reach your track system. We make these units to fit between existing bowl feeders and track.

By culling-out tramp materials, bad parts and misoriented parts, our inspectors assure jam free tracking to your work stations.

If you're planning for new feeders, consider built-in orientor-inspector tooling now.

Want reliable parts feeding performance? Check with the Spectrum people for solutions you can bank on.

All Jammed Up ...

... because your feed tracks can't handle bad parts and junk?

You can't make money while machines stand idle and frustrated people beat the jams out of your track.

Let Spectrum get the junk out; ahead of your tracks.

Call or write for money making solutions to your parts feeding and assembly problems.
