

These plates are used for "spin-on" oil filters. We feed them to process and assembly operations at 140 per minute.

The "material saving" plate (with edge flats) limits feeder output at 140 per minute. If it were dropped from this family the others could be fed near 200 per minute.

Sound pressure is held to 85 dBa in this machine. Extra control media will limit noise at 80 dBa.

Simple tooling and standardized machines are your best choice for performance reliability. Get them from **Spectrum**.

Get It Right...

... the first time.

Get with **Spectrum** first, for your feeder needs.

You'll profit sooner.
