

Fitted with a face to face orientor, this feeder gets ring and disc type parts to a centerless grinder.

Bearing races, ball seats and similar parts are fed in a smooth constant flow at 100 pieces per minute. A variable speed, adjustable face-cam does the feature work of this machine.

Feed track and face-cam units are easily moved to compensate for grinding wheel wear.

Tramp material is ejected from the system by a vibratory preorientor.

And it's quiet. Less than 85 DBA. Interested? Call **Spectrum**.

You Need More...

... than a price for your next feeder. You need the best feeder.

Get the best from the feeder people. **Spectrum** of course.
