

This Spectrum package gets plastic rings assembled to nuts for a stake operation at more than 175 pieces per minute.

A pair of feeders get the two parts to an assembly unit.

Specially designed, rotary motion, assembly tooling strips the rings, inserts them into nuts and strips the assemblies to a discharge track.

Lack of rings automatically stops the assembly action to avoid processing empty nuts.

Quick change tooling permits handling a family of parts with little change-over downtime.

Feeders and simple assembly machines: Spectrum specialties.

Put 'em together...

... with simple machinery.

get your simple, cost effective feed-assembly units at Spectrum.
