

These diesel engine parts are fed to a centerless grinder at 60 pieces per minute. They are stored, elevated, oriented, tracked and escaped onto a feed conveyor.

The escapement keeps the conveyor filled with

face-to-face, oriented parts, regardless of grinder rate.

Precision cast, combustion cups are automatically handled gently, quietly and efficiently for a number of other process and inspection operations.

# Innovation...

... is our middle name.

Creative thinking and productive solutions to parts feeding problems are the way of life at Spectrum.

Call, write or drop in and take advantage of our talent and experience. You'll profit!
