

Data Bolts are among...

...thousands of fastener designs effectively handled by Spectrum feeders.

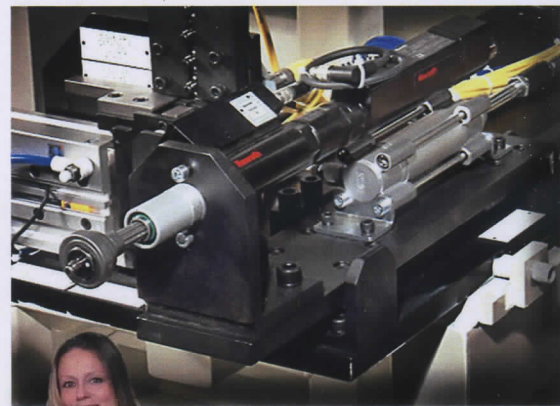

Typical Bolts are stored, oriented, distributed to multi paths, tracked, presented and driven (torque monitored) into assembly.

Data Bolts are fed to a single driver for temporary installation, at the start of each product build.

A memory chip in the Bolt head collects quality information from each operation.

At assembly completion, the memory chip information is assessed.

The Bolt is removed, and the chip is erased for reuse.

Gentle Quiet Effective
