

Mounting plates for spin-on oil filters are fed to six tapping spindles at more than 90 pieces per minute.

This Spectrum, gravity orienting, feeder is furnished with a "keep-full" storage release system to get parts, only, to working spindles. It gets optimum

production from working spindles without recirculation.

The "keep-full" system replaces troublesome, tight tolerance chute systems that have plagued the filter industry for years.

It's all done, easily, within 85 dBA noise limits (or lower, if required).

Multi-path...

... feeders make sense when they're reliable.

Spectrum's feeders make sense and dollars because they are reliable.

Call, write or drop in and let Spectrum's team make sense and dollars for you.
