

Hub forgings are sorted from trim scrap at 100 pieces, per minute, with this feeder system.

Full gondolas of hubs and trim are dumped into a floor bin-elevator and metered onto vibratory sorting tooling.

Trim scrap is directed to one gon while hubs go

to another.

Two different hub designs are handled without changeover.

Sound pressure is limited to 90 dBA despite the high rate of production.

Sort out...

... your feeder problems with SPECTRUM's solutions.

Parts feeding solutions by SPECTRUM are many, varied and profitable for over 2,000 satisfied customers.
