

Parts are gently flow metered from stock boxes and oriented to feed final operations without quality sacrifice. Finished gear teeth and quality surfaces of many other parts are preserved within this bulk handling feeder concept.

Stock container is inserted (Fig. A), then autorotated to flow parts to the fall control rim (Fig. B) and metered for orientation. Gentle handling of quality parts *into* or *from* bulk storage? Spectrum has cost effective solutions.

# Don't bruise 'em

Let Spectrum feed your quality parts.
