# Overhead Conveyance System

## Challenge

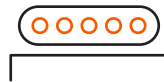

A customer had a 30-foot process enclosure with an overhead monorail carrying two-ton parts through it. The work pieces are hooked to roller dollies. The customer also needed a means to power the dollies slowly along the enclosure.

## Result

To address this, we designed and built a special conveyor with a pair of outbound dolly pushers that had to be suspended from overhead trusses due to processing clutter. A loaded dolly is manually moved to the enclosure where a sensor starts our push action.

Custom Conveyor

Custom dolly pushers

Custom trusses
